1. Project Background (5)

The project is designed to automate the process of submitting and approving employee travel requests. The solution allows employees to provide their travel information through a Microsoft Form. The submitted information is intended to be stored in a structured SharePoint list for easy management and tracking. The SharePoint list contains important information such as the travel request title, status, destination, purpose, travel dates, requester details and approver. The status of each request can be maintained as Pending, Approved or Declined. Power Automate is then used to automate the approval process by detecting new travel requests and sending an approval request to the appropriate approver. The approver can review the request and approve or decline it. The SharePoint record can then be updated based on the approval decision. An automated email notification can also be sent to the requester to inform them of the outcome. The overall solution helps reduce manual processing, improve visibility of travel requests and provide a consistent approval process.

2. Project Specifications(5)

Tool	Purpose
Microsoft Forms	Used to create the digital Travel Request Form for collecting employee travel information.
Microsoft SharePoint	Used to store and manage travel request records in a structured list.
Power Automate	Used to automate the travel request approval workflow, including approval requests and email notifications.
Approvals Center	Used by the approver to review and approve or decline travel requests.

Approach Used to Execute the Project

The project was implemented in stages. First, a Microsoft Form was created to collect the required travel request information from employees. Next, a SharePoint site and Travel Requests list were configured to store the submitted information. Appropriate columns and data types were created to maintain structured and meaningful travel request data. The next stage is to create a Power Automate workflow that connects the SharePoint list with the approval process. The workflow will trigger when a new travel request is created, send the request to the designated approver, update the request status based on the approval decision, and notify the requester by email. Finally, the complete solution will be tested from request submission through approval and notification.

3. Project Task (30)

You are required to revisit your three selected assignments and to apply the skills and methodologies learned in your assignments.

Task 1 - Configure MS Form and SharePoint Travel Request List

- Create and configure the SharePoint list to store travel requests
- Define required columns (Title, Status)

Provide Screenshots of your completed Task (space below)

MS Forms

Sharepoint List with required columns

- **Figure 1: Microsoft Forms Travel Request Form**

A Microsoft Forms Travel Request Form was created to collect the information required for an employee travel request. The form contains questions for the travel purpose, destination, start date, end date, requester name and requester email.

Travel Request Form

1. What is the purpose or reason for your travel request? *
2. What is your intended travel destination? *
3. What date do you plan to start your travel? *
4. What date do you plan to return from your travel? *
5. What is your full name? *
6. What is your email address? *

- **Figure 2: SharePoint Travel Requests List with Required Columns**

A SharePoint **Travel Requests** list was created to store the travel request information. The list includes the required **Title** and **Status** columns, together with additional columns for destination, purpose, travel dates, requester information and approver details.

- **Figure 3: Configure MS Form and SharePoint Travel Request List**

A Power Automate flow named **Travel Form to SharePoint** was created to transfer submitted Microsoft Forms responses to the **Travel Requests** SharePoint list. The flow uses the **Microsoft Forms trigger**, retrieves the response details, and creates a new SharePoint list item with the submitted travel information.

The figure consists of four screenshots illustrating the configuration of a Power Automate flow:

- When a new response is submitted:** This screenshot shows the trigger configuration. The "Form Id" is set to "Travel Request Form".
- Get response details:** This screenshot shows the action configuration. The "Form Id" is set to "Travel Request Form" and the "Response Id" is selected from the previous step's output.
- Create item:** This screenshot shows the action configuration for creating a new item in a SharePoint list. The "Site Address" is "Travel Request Management - https://educiaasglobal.sharepoint.com/sites/TravelRe...", the "List Name" is "Travel Requests", and the "Title" is "What is your full...".
- Flow completion:** This screenshot shows the final flow canvas with the steps "When a new response is submitted", "Get response details", and "Create item" connected in sequence. A message at the top states: "Your flow is ready to go. We recommend you test it."

Task 2 - Build Power Automate Approval Workflow (40)

- Create a Power Automate flow triggered by new SharePoint list items
- Configure approval actions using the Approvals Center and email
- Update request status based on approval outcome
- Send automated confirmation emails to requesters.

Provide Screenshots of your completed Task

Completed PowerAutomate Flow with connectors

Screenshots must demonstrate that the connectors are configured.

A Power Automate approval workflow was created to automate the Travel Request approval process. The workflow is triggered when a new item is created in the SharePoint **Travel Requests** list. The flow then starts an approval request using the **Start and wait for an approval** action. The approver can review the travel purpose, destination, start date, end date, requester name, and requester email before approving or declining the request.

A condition was configured to check the approval outcome. If the request is approved, the True branch updates the SharePoint item's Status to **Approved** and sends an automated approval email to the requester. If the request is declined, the False branch updates the Status to **Declined** and sends an automated decline email to the requester. The workflow therefore connects SharePoint, Approvals, and Outlook to automate the complete approval process.

The screenshot shows the configuration for the 'When an item is created' trigger in Power Automate. The trigger is highlighted with a red box. Below the trigger, the 'Parameters' tab is selected, showing the 'Site Address' and 'List Name' fields. The 'Site Address' is set to 'Travel Request Management - https://educlaasglobal.sharepoint.com/sites/TravelReque...' and the 'List Name' is set to 'Travel Requests'. The 'Advanced parameters' section shows 'Showing 0 of 1' and buttons for 'Show all' and 'Clear all'.

Your travel request has been declined following the approval review.
Thank you.

Task 3 – Test and Deploy the Solution (20)

- Perform end-to-end testing of submission, approval, and notification steps
- Validate approval visibility in the Approvals Center.

Provide Screenshots of your completed Task

Approval request sent to approver

Approval Email sent to requestor

PowerAutomate Flow with GREEN Ticks

The completed Travel Request solution was tested through the submission, approval, and notification process. A travel request was submitted through Microsoft Forms and successfully processed through the Power Automate approval workflow.

The approval request was successfully displayed in the **Approvals Center**, where the approver could review and approve the travel request.

- **Figure 1: Approval request sent to approver**

The approval request was successfully displayed in the **Approvals Center**, where the approver could review and approve the travel request.

- **Figure 2: Approval Email sent to requestor**

After approval, an automated confirmation email was successfully sent to the requester with the travel request details and approval confirmation.

- **Figure 3: Power Automate Flow with GREEN Ticks**

The Power Automate workflow was successfully executed, with green ticks displayed for the completed actions in the flow.

Project Conclusion

The project successfully automated the travel request and approval process using Microsoft Forms, SharePoint, and Power Automate. Travel requests can be submitted through the form, stored in SharePoint, sent to an approver, and automatically updated and communicated through email. The testing showed that the complete approval workflow worked successfully.

Possible Improvements

In the future, the system could be improved by adding stronger form validation, better email formatting, and more detailed notifications for rejected requests. A dashboard could also be added to monitor travel requests, approval status, and overall workflow performance.
