1. Purpose of this Project

This Project is used for the Summative Assessment of learners in the Module 'WSQ ROBOTIC PROCESS AUTOMATION (SF)BUILD SANDBOX'. This project is designed to equip learners with the foundational and applied knowledge to automate business processes using Microsoft's suite of Power Platform tools. It enables participants to understand, design, and implement automation solutions that improve operational efficiency and digital capability.

2. Project Pre-requisites

You should have completed the following activities before starting the module project:

- Viewed and understood all the e-content related to the module
- Completed all the MCQ tests related to the module
- Completed all the Assignments of the module

You should have access to the Project Brief and the Project Report template, and you should understand how to use them.

You should have access to the Project Technical Environment.

3. Project Scenario

The organization requires a standardized process for requesting and approving employee travel. This project implements a travel request approval workflow using SharePoint List and the Approvals Center to ensure visibility, accountability, and automated notifications.

Roles

Requester: Any employee submitting a travel request

Approver: Any authorized person within the organization

System: SharePoint, Approvals Center, and email notification service

Scenario Flow

1. An employee submits a travel request through a form connected to a SharePoint list.
2. The request is stored as a SharePoint list item.
3. An approval request is automatically sent to the designated approver.
4. The approver can review and act on the request either:
 - i. Through the Approvals Center, or
 - ii. Directly from an email notification
5. The approver approves or declines the request.
6. The SharePoint list item is updated with the decision.
7. Once the decision is recorded, the requester receives a confirmation email indicating whether the request was approved or declined.

Data Requirements

The SharePoint list used to manage travel requests **must include** the following columns:

- Title – Description or purpose of the travel request
- Status – Current state of the request (e.g., Pending, Approved, Declined)

- Add additional columns (beyond Title and Status) to capture meaningful travel details such as travel dates, destination, purpose, and approver
- Define appropriate column types, default values, and permissions to ensure data quality and usability

Project Objectives

The objective of this project is to design and implement an automated travel request approval process using SharePoint and Power Automate that enables employees to submit travel requests and allows authorized approvers to review, approve, or decline requests through the Approvals Center or email. The solution will ensure consistent tracking of request status, provide timely notifications to requesters, and improve efficiency, transparency, and governance of travel approvals across the organization.

4. Project Task List

You are required to revisit your three selected assignments and to apply the skills and methodologies learned in your assignments.

Task 1 - Configure SharePoint Travel Request List

- Create and configure the SharePoint list to store travel requests
- Define required columns (Title, Status)

Task 2 - Build Power Automate Approval Workflow

- Create a Power Automate flow triggered by new SharePoint list items
- Configure approval actions using the Approvals Center and email
- Update request status based on approval outcome
- Send automated confirmation emails to requesters.

Task 3 - Test and Deploy the Solution

- Perform end-to-end testing of submission, approval, and notification steps
- Validate approval visibility in the Approvals Center.
